calculus is a branch of mathematics that deals with rates of change and the accumulation of quantities.

precalculus \rightarrow calculus II

$$|a| = |-a|, |ab| = |a||b|$$

The **distance** between two real numbers a and b is $|b - a|$, which is the length of the line segment joining a and b .

Two real numbers a and b are close to each other if $|b - a|$ is small, and this is the case if their decimal expansions agree to many places. More precisely, *if the decimal expansions of a and b agree to k places (to the right of the decimal point), then the distance $|b - a|$ is at most 10^{-k} . Thus, the distance between $a = 3.1415$ and $b = 3.1478$ is at most 10^{-2} because a and b agree to two places. In fact, the distance is exactly $|3.1415 - 3.1478| = 0.0063$.*

Beware that $|a + b|$ is not equal to $|a| + |b|$ unless a and b have the same sign or at least one of a and b is zero. If they have opposite signs, cancellation occurs in the sum $a + b$ and $|a + b| < |a| + |b|$. For example, $|2 + 5| = |2| + |5|$ but $|-2 + 5| = 3$, which is less than $|-2| + |5| = 7$. In any case, $|a + b|$ is never larger than $|a| + |b|$ and this gives us the simple but important **triangle inequality**: $|a + b| \leq |a| + |b|$

$$\begin{aligned}[a, b] &= x \in \mathbb{R} : a \leq x \leq b \\ (a, b) &= x \in \mathbb{R} : a < x < b \\ [a, b) &= x \in \mathbb{R} : a \leq x < b \\ (a, b] &= x \in \mathbb{R} : a < x \leq b\end{aligned}$$

$$(-r, r) = x : |x| < r$$

circle: $(x - a)^2 + (y - b)^2 = r^2$ where (a, b) is the center and the radius is r

midpoint between $P_1 = (x_1, y_1)$ and $P_2 = (x_2, y_2)$ is P_1P_2 divided by 2

laws of exponents:

- $x^m x^n = x^{m+n}$
- $\frac{x^m}{x^n} = x^{m-n}$
- $(x^m)^n = x^{mn}$
- $x^{-n} = \frac{1}{x^n}$
- $(xy)^n = x^n y^n$
- $(\frac{x}{y})^n = \frac{x^n}{y^n}$
- $x^{1/n} = \sqrt[n]{x}$
- $x^{\frac{m}{n}} = \sqrt[n]{x^m} = (\sqrt[n]{x})^m$

special factorizations

- $x^2 - y^2 = (x + y)(x - y)$
- $x^3 + y^3 = (x + y)(x^2 - xy + y^2)$
- $x^3 - y^3 = (x - y)(x^2 + xy + y^2)$

binomial theorem:

- $(x + y)^2 = x^2 + 2xy + y^2$
- $(x - y)^2 = x^2 - 2xy + y^2$
- $(x + y)^3 = x^3 + 3x^2y + 3xy^2 + y^3$
- $(x - y)^3 = x^3 - 3x^2y + 3xy^2 - y^3$
- $(x + y)^n = x^n + nx^{n-1}y + \frac{n(n-1)}{2}x^{n-2}y^2 + \dots + \binom{n}{k}x^{n-k}y^k + \dots + nxy^{n-1} + y^n$
where $\binom{n}{k} = \frac{n(n-1)\dots(n-k+1)}{1\cdot 2\cdot 3\cdot \dots\cdot k}$

quadratic formulae:

1. $ax^2 + bx + c = 0$
2. $x^2 + \frac{b}{a}x + \frac{c}{a} = 0$
3. $x^2 + \frac{b}{a}x = -\frac{c}{a}$
4. $x^2 + \frac{b}{a}x + \left(\frac{b}{2a}\right)^2 = -\frac{c}{a} + \left(\frac{b}{2a}\right)^2$
5. $\left(x + \frac{b}{2a}\right)^2 = \frac{b^2 - 4ac}{4a^2}$
6. $x + \frac{b}{2a} = \pm \frac{\sqrt{b^2 - 4ac}}{2a}$
7. $x = -\frac{b}{2a} \pm \frac{\sqrt{b^2 - 4ac}}{2a}$

8. $x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}$

rational $p(x)/q(x)$

root $\sqrt[n]{g(x)}$

properties:

domain: set of all input values for which the function is defined

range: set of all possible output values of the function

continuity: most algebraic functions are continuous (no breaks or jumps), but rational functions have discontinuities at points

behavior: the functions behavior is influenced by the degree of the polynomial and the nature of the function

scaling:

- vertical scaling $y = kf(x)$: If $k \geq 1$, the graph is expanded vertically by the factor k . If $0 < k < 1$, the graph is compressed vertically. When the scale factor k is negative ($k < 0$), the graph is also reflected across the x-axis.
- horizontal scaling $y = f(kx)$: If $K \geq 1$, the graph is compressed in the horizontal direction. If $0 < k < 1$, the graph is expanded. If $k \leq 0$, then the graph is also reflected across the y-axis.

SOH-CAH-TOA is a mnemonic device that expresses the relationship between the basic trigonometric functions and the ratios of the sides in a right triangle.

trigonometric functions are mathematical functions that relate the angle of a triangle to the lengths of its sides... and can also be generalized to all real numbers using the unit circle.

To derive the rest of the fundamental trigonometric identities, you need a combination of a few key identities and principles. The most important starting point is the Pythagorean identity, but you'll also need the basic relationships between the trigonometric functions, such as the definitions of sine, cosine, tangent, secant, cosecant, and cotangent in terms of a right triangle or the unit circle.

Essential Theorems:

- **Intermediate Value Theorem (IVT):** Guarantees that a continuous function takes every value between $f(a)$ and $f(b)$ at some point in the interval $[a, b]$.
- **Mean Value Theorem (MVT):** States that for a continuous and differentiable function, there is at least one point where the instantaneous rate of change equals the average rate of change over the interval.
- **Extreme Value Theorem:** Guarantees that a continuous function on a closed interval attains a maximum and minimum value.
- **Fundamental Theorem of Calculus:**
 1. **First Part:** The derivative of the integral of a function is the original function.
 2. **Second Part:** The definite integral of a function can be computed using its antiderivative.

5. Find the third derivative of $f(x) = 4x^3 + 3x^2 - 2x + 5$
6. Find the first and second derivatives of $f(x) = \ln(x^2 + 1)$
7. Find the second derivative of $f(x) = \tan(x)$
8. Find the fourth derivative of $f(x) = 7x^4 - 6x^2 + x - 3$
9. Find the second derivative of $f(x) = \frac{x^3}{x^2+1}$
10. Find the third derivative of $f(x) = x^4 \ln(x)$
